Overview

We wanted a face recognition based authentication application that is simple, yet particular. We deployed our test using:

- ▶ A web interface¹ that works as a demonstrative placeholder. It gets the face with the camera, makes requests to our API server, which returns only a binary value for the success of the authentication.
- ► An **API** server² that queries the faces database and recognizes faces using the **OpenBR's tool**³.
- ► A database based on Blockchain⁴ that is an open source wrapper for a blockchain database that can be queried with standard SQL syntax.

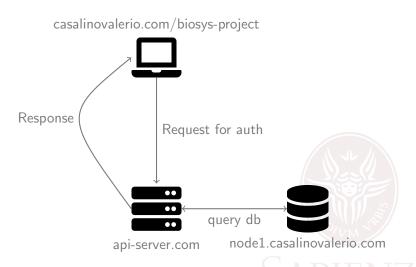

¹Hosted by Github Pages: https://pages.github.com/

The Block-chain database

As database for new faces, we implemented a **Block-chain**. We used an open-source implementation of it, called BigchainDB⁶. We also used Docker⁷ to deploy 4 containers running the application.

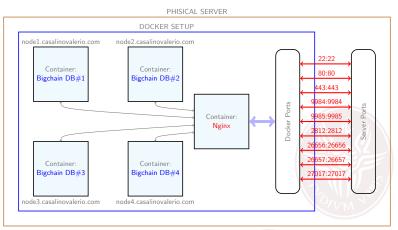

⁶Main page: https://www.bigchaindb.com. Documentation here.

⁷Main page: https://www.docker.com.

Architecture Implementation

!!This is absolutely not meant for a real deployment!!

How to interact with the DB

We are assuming that we have an enstablished connection set up.

Query data

```
connection.searchAssets('AwesomeAsset')
.then(assets => console.log('Found assets:', assets))
// Read the console to look at the assets
```

Load data (make a transaction)

```
// Create transaction first (txTransferBob)
driver.Transaction.signTransaction(txTransferBob,
alice.privateKey);
conn.postTransactionCommit(txTransferBobSigned);
```

Simple as that...
