**Performance Assessment** 

Conclusions

#### **Premise**

Before we start, let us say that all of our work, included this own presentation, is open sourced and available on Github:

https://github.com/casalinovalerio/biosys-project

There is also a script to replicate our setup for future projects.

#### **Overview**

We wanted a face recognition based authentication application that is simple, yet particular. We deployed our test using:

- ▶ A web interface¹ that works as a demonstrative placeholder. It gets the face with the camera, makes requests to our API server, which returns only a binary value for the success of the authentication.
- ► An **API** server<sup>2</sup> that queries the faces database and recognizes faces using the **@ageitgey's tool**<sup>3</sup>.
- ► A database based on Blockchain<sup>4</sup> that is an open source wrapper for a blockchain database that can be queried with standard SQL syntax. Implemented on the API server too.

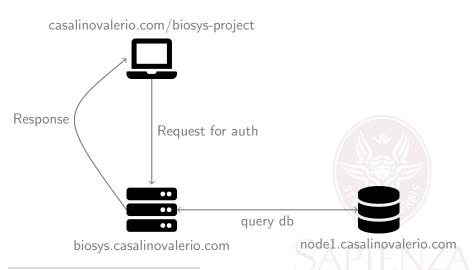

<sup>&</sup>lt;sup>1</sup>Hosted by Github Pages: https://pages.github.com/

### Front-end Implementation

**Data-set Management** 

**Biometric Scanning Integration** 

**Performance Assessment** 

Conclusion

# The web Application

The web application perform the authentication as follows:

- ► Captures frames in a canvas.
- ► Analyzes them through the opency's javascript<sup>6</sup>.
- ► As the time one button is pressed, the canvas frame is sent to our server<sup>7</sup>, which can register the face, or match the face with an already registered user.
- ► In the end, you can be registered, or you can get the authentication response status.

#### Does it work?

We actually did some **serious** testing on it. As you can clearly see in the picture below, it works!

SAPIENZA Università di Romana

Front-end Implementation

### **Data-set Management**

**Biometric Scanning Integration** 

**Performance Assessment** 

Conclusions

#### The Block-chain database

As database for new faces, we implemented a **Block-chain**. We used an open-source implementation of it, called BigchainDB<sup>8</sup>. We also used Docker<sup>9</sup> to deploy 4 containers running the application.

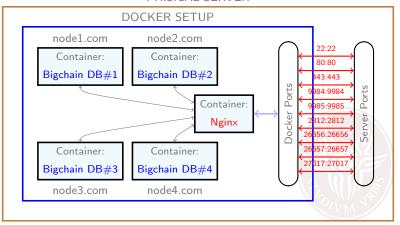

<sup>&</sup>lt;sup>8</sup>Main page: https://www.bigchaindb.com. Documentation here.

<sup>&</sup>lt;sup>9</sup>Main page: https://www.docker.com.

# **Architecture Implementation**<sup>10</sup>

#### PHISICAL SERVER

<sup>&</sup>lt;sup>10</sup>This is absolutely not meant for a real deployment!!

### How to interact with the DB

We are assuming that we have an enstablished connection set up.

#### Query data

```
connection.searchAssets('AwesomeAsset')
.then(assets => console.log('Found assets:', assets))
// Read the console to look at the assets
```

# Load data (make a transaction)

```
// Create transaction first (txTransferBob)
driver.Transaction.signTransaction(txTransferBob,
alice.privateKey);
conn.postTransactionCommit(txTransferBobSigned);
```

Simple as that...

**General Concepts & Decisions** 

Front-end Implementation

**Data-set Management** 

# **Biometric Scanning Integration**

**Performance Assessment** 

Conclusions

# Connecting the Web app to API server

```
Send faces function in web app
...
var canvas = document.getElementById("canvasOutput");
picture.src = canvas.toDataURL();
...
xhr.open('POST', 'url/send-faces.php', true);
...
```

```
Recognize face function in web app
...
var canvas = document.getElementById("canvasOutput");
picture.src = canvas.toDataURL();
...
xhr.open('POST', 'url/reco-faces.php', true);
...
```

# Connecting the API to the DB

This is how we did it:

# **Getting the response**

This is how we did it:

**General Concepts & Decisions** 

Front-end Implementation

**Data-set Management** 

**Biometric Scanning Integration** 

**Performance Assessment** 

Conclusion

### How we tested

We tested our solution with a custom script.

### Use the script (to edit)

./test.sh -d /path/to/test-faces

For more info on how the script works, just look at it 11, it is open source!

We let the script run on the same server for the longest time possible, until we could obtain a reasonable evaluation.

<sup>&</sup>lt;sup>11</sup>Script here: this-is.temp

# **Testing approach**

# How it performed

Really well, it is a revolutionary project!

**General Concepts & Decisions** 

Front-end Implementation

**Data-set Management** 

**Biometric Scanning Integration** 

**Performance Assessment** 

Conclusions

#### **Conclusions**

It wasn't an easy project, but we did our best. At the end of it all, we learned:

- ▶ How to gather information on standards and OS solutions available.
- ▶ Deploy an actual service relying on ourselves.
- ▶ How to evaluate a BS performance in an automatic way.

Performance consideration here.

# **Greetings from the group**

This is a really great ending message from the "creative" chilled-capibaras!

And this is a real cool catchy phrase!!
